

Supplementary Materials: Feasibility of A Novel On-Site Detection Method for Aflatoxin in Maize Flour from Markets and Selected Households in Kampala, Uganda

Alex Paul Wacoo, Deborah Wendi, Sarah Nanyonga, Joseph F. Hawumba, Wilbert Sybesma and Remco Kort

Figure S1. The image of the assembled portable electrochemical immunosensor designed for the on-site detection of aflatoxins.

The operation of the immunosensor has been previously reported by Wacoo et al. [1]. Data acquisition, analysis and display were performed by a locally designed potentiostat enclosed in a small casing. The device is portable, weighs approximately 450 g and 19 cm × 11 cm × 6 cm in size and is powered by replaceable batteries and therefore well-suited for on-site application [2].

Figure S2. Current practice of 'quality and safety assessment' of flour at the Bweyale Market in the Kirandongo District, Uganda. (A) Evaluation of texture by the customer, and (B) Evaluation of taste (bitterness) by the saleswoman.
